Animalia - Arthropoda - Insecta - Hymenoptera - Apidae

## Genus: *Apis*

Scientific Name	Common Name	Native Range / Origin
<i>Apis dorsata</i>	Giant Honey Bee	Southeast Asia
<i>Apis florea</i>	Dwarf Honey Bee	Southeast Asia
<i>Apis cerana</i>	Indian Honey Bee	SE Asia to India
<i>Apis mellifera</i>	European Honey Bee	Europe, Middle East & Africa

Relative body size of the four major *Apis* species

*Apis dorsata*

Giant Honey Bee

# European Honey Bee

*Apis mellifera*

*Apis mellifera ligustica*

Italian race

*Apis mellifera mellifera*

**German race**

*A. m. caucasica*

*A. m. carnica*

Carniolan & Caucasian races

# Characteristics of major *Apis mellifera* races

Characteristic	Italian	German	Carniolan	Caucasian
Latin name	ligustica	mellifera	carnica	caucasica
Origin	Italy	n. Europe	Macedonia	s. Russia
Swarming tendency	fair	fair-strong	strong	weak
Use of propolis	moderate	moderate	moderate	excessive
Temperament	gentle	defensive	gentle	gentle
Robbing tendency	strong	strong	weak	strong
Spring build-up	fast	slow	moderate	moderate
Overwintering	fair	good	good	good

# Hybrids

# TYPES & HYBRIDS

---

**Italian Hybrids** (e.g. “Midnite”, “Starline”, “All-American”)  
gentle, good honey producer, little or no parasite resistance, overwintering fair

**Old World Hybrids** (e.g. “Buckfast”)  
very gentle, great honey producer, tracheal mite resistant, overwintering good

**Carniolan Hybrids** (e.g. “New World Carniolan”)  
gentle, fair honey producer, tracheal mite resistant, overwintering fair

**Mite-resistant stock** (e.g. “SMR”. “Harbo”)  
some varroa mite resistance, but poor honey producer

**Russian Bees** (e.g. “Purple”, “White”, “Green’, etc.)  
gentle, good honey producer and overwintering, some varroa mite resistance

# Africanized Bees

*Apis mellifera x scutellata*

# Progression of the Africanized Honey Bee

University of California Cooperative Extension

By Todd Rasmussen  
Special for USA TODAY

**PHOENIX** — The trouble started with a loud crashing from under John and Gina Messina's bedroom floor. Before the nightmare was over, 30,000 bees had crawled through a neighborhood, attacking people and neighborhood dogs with a frenzy. Beekeeper Alred Hancock said, "The king progressed" attack of the Africanized killer bees had arrived.

"They were just knocking up several houses, especially attacking people," he said. "When I saw them, I just had to do it." So he grabbed a car, drove the bees away, and ran. "I backed up and drove away."

Two more swarms of bees had arrived in the Yuma County town since the first one. "It's like we're under siege," Hancock said.

Two more swarms of bees had arrived in the Yuma County town since the first one. "It's like we're under siege," Hancock said.

**30,000 bees swarm, 'wouldn't go away'**

**Bees from 2 more swarms identified as Africanized**

If the Sasabe swarms represent the first colonies of Africanized bees migrating into Arizona, Tucon residents can expect to see the bees next spring.

The Arizona Daily Star

**DEATH OF STEVE RUE**

Steve RUE, 47, was found dead in his home in Phoenix on July 19, 1993. He had been stung by killer bees.

**Savage stingers make a beeline for San Diego**

By STEVE LA RUE  
Staff Writer

They lurked for months in a crawl space under a Phoenix home. Then, on Oct. 9, came their nest in an amateurish attempt of so-called killer bees filled the that moved in the Phoenix area's from Brazil, which first entered tax in 1990.

It's in a three-block area in our five people were stung hospitalized. Two dogs lay life. It was right around were in their houses any J. Creekmore, a police unit of Peoria,

have reached California. Trapped at the dam, the Aransas line.

Imperial Valley as 1970, and I sus in San Diego," California D

This map shows the progression of the bees since 1957, when they escaped from a research facility in Brazil.

**Killer bees' called likely culprits**

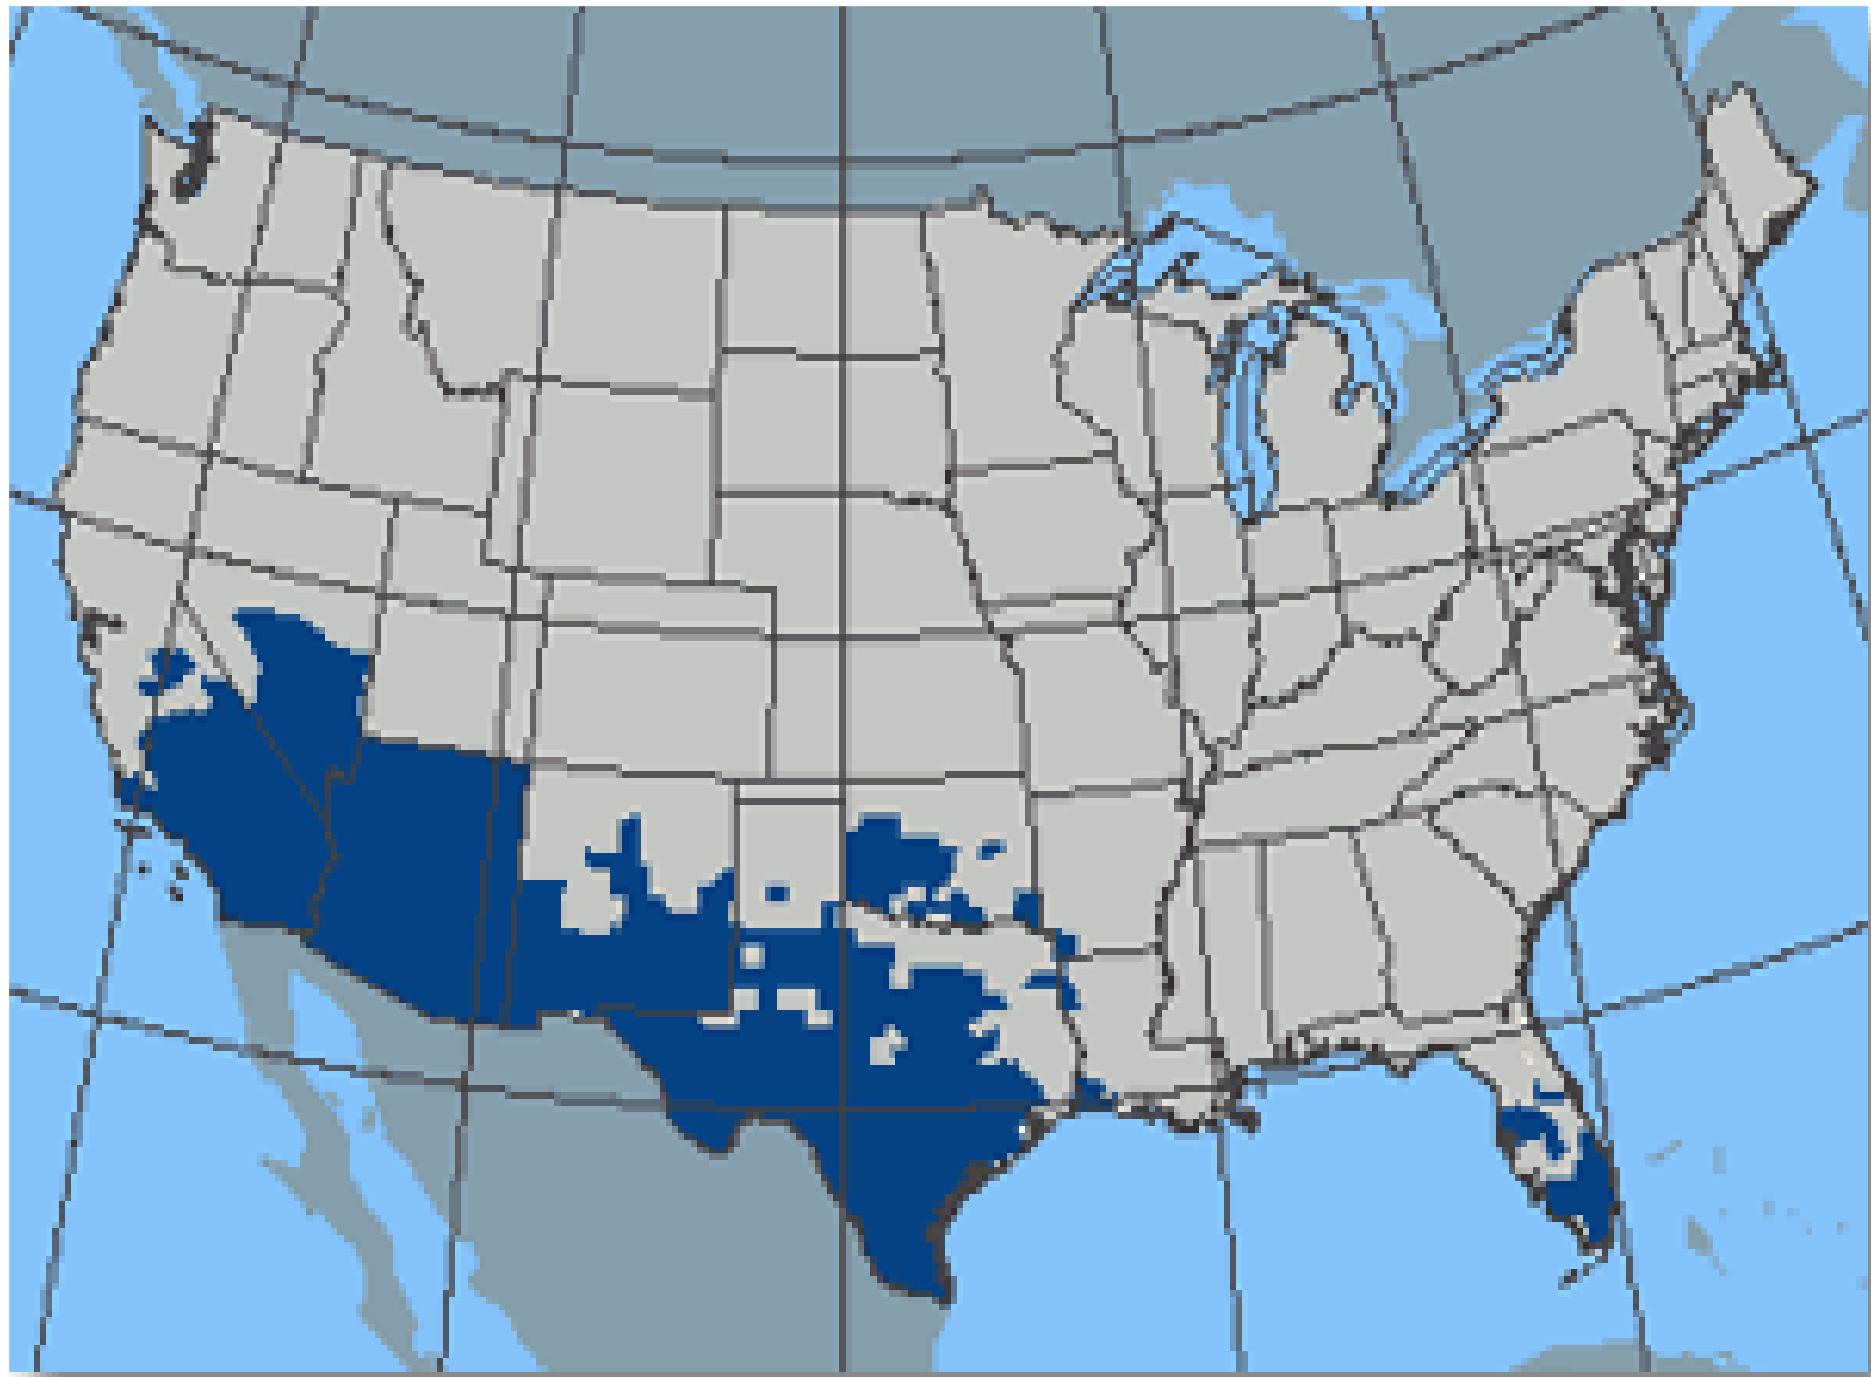

By STEVE LA RUE  
Staff Writer

Africanized bees are said to sting 10 times more often to be much more aggressive, and to pursue victims much farther than indigenous European bees, which they resemble.

The dead bees from Mexico have been shipped to a laboratory in Mexico City, and positive identification is expected in a week or two. We anticipate that the main infestation will be next year.
